# Blooger 1000

Well First thing's first, you gotta get python, simplest choice is the microsoft store, if you don't already have it look up python and click on the get button underneath, this app is made with the latest python so some features may not work on older versions :3.
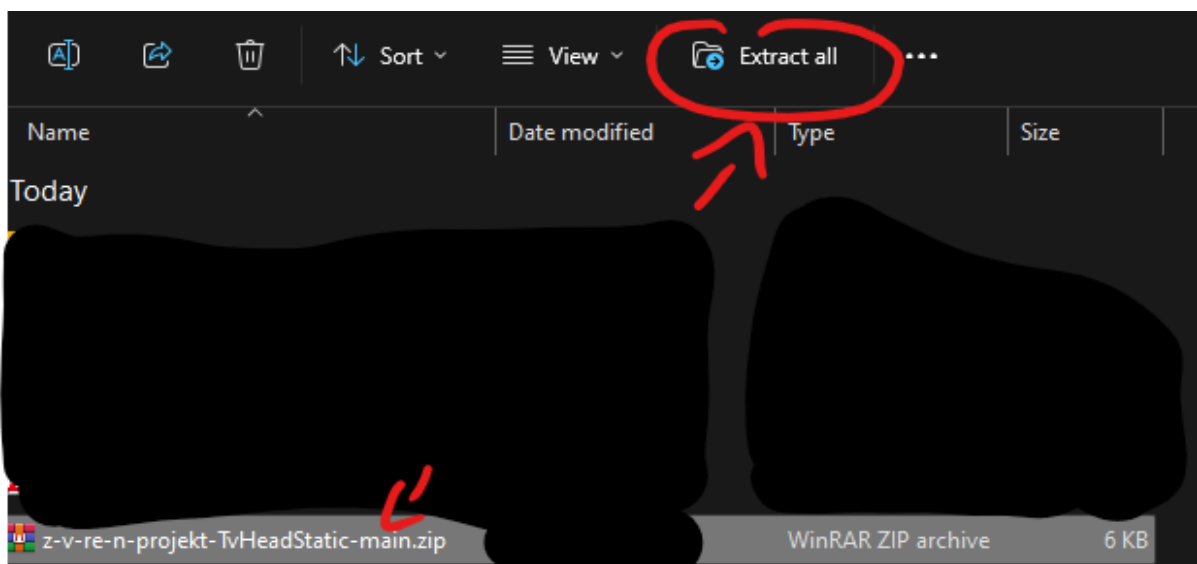

Now let's continue shall we :3

Soo assuming you don't have it downloaded, if you do then you can skip this step.
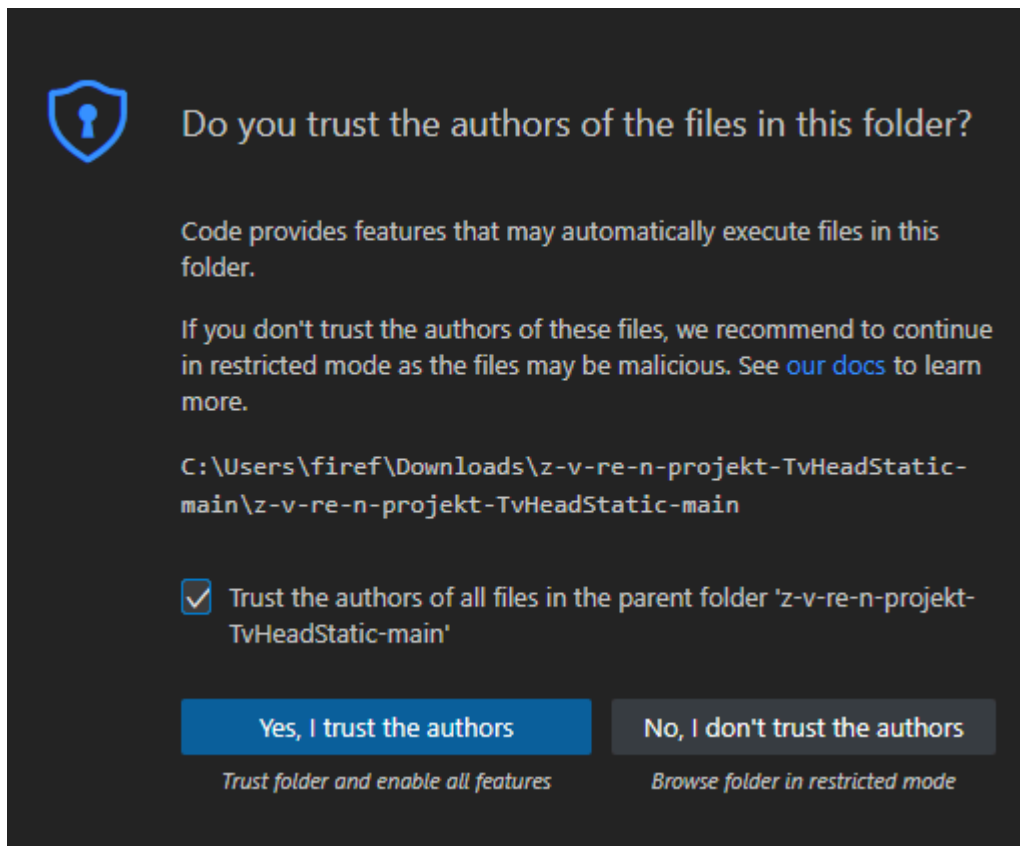

-You go onto github, look up the user, and select the repository that contains said file. After you've located the file, you click on it to show the code. You download the zip.

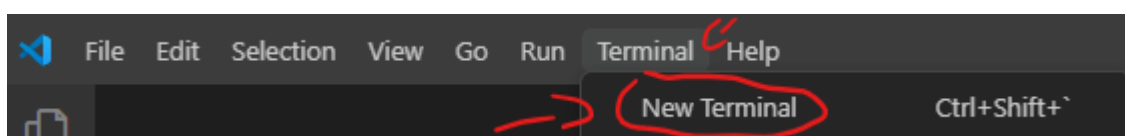

-After downloading the zip file, you locate it and press extract all.

-After extracting the file you can just drag and drop it into VSC. After doing so you should see a pop up, press trust to proceed.

-After you've opened the folder in VSC, you go to open a new terminal in VSC assuming one isn't already available.

-You should be hit with this interface.

-And now you simply type python Flesk/main.py

-If you followed all the step correctly you should see this

```
 * Serving Flask app 'main'
 * Debug mode: on
WARNING: This is a development server. D
 * Running on http://127.0.0.1:5000
Press CTRL+C to quit
 * Restarting with stat
 * Debugger is active!
 * Debugger PIN: 106-893-189
```

-Not how do get to the site you ctrl+click on the https link.

```
 * Debug mode:
ARNING: This        Follow link (ctrl + click)     er.
 * Running on   http://127.0.0.1:5000
```

-And here you have it you successfully launched the site locally, meaning you can go ahead and test it out
